CARBON INJECTION TECHNOLOGY

We started to use carbon Long fibers with nylon Injection to Create carbon high texture lightweight products. Long fibers in the pellet form Advantage.

FATIGUE TESTING MACHINE

To ensure the safety of riders, we thoroughly test every product according to the “CEN” standards. It’s our goal to let our riders not only experience lightweight but also safety.

INSPECTION MACHINE

Our lightweight carbon-fiber made products are of the finest quality. To assure this quality, we test our carbon-fiber products from top to bottom with the inspection machine.

MICROCOMPUTER ATTENUATION TESTER

We are our pioneers in product quality and know that carbon-fiber is an ambiguous material.

Therefore we also check our carbon-fiber made products’ strength by our Microcomputer Attenuation Test. The test puts them under 150kg of pure force, two times, for 30 seconds. The result, a safe and reliable product that every rider can trust.our carbon-fiber products from top to bottom with the inspection machine.

HARDNESS TESTING MACHINE

To assure the intensity and safe structure of our products to meet the international standards, we carry out discreet sample inspection to pass the hardness test. It is important to us that we deliver consistency in our product quality.

COORDINATE MEASURING MACHINE

The coordinate measuring machine is key to reach our goal of high product standards. We only want to provide our customers the best and most excellent quality. Therefore we use 2.5D CMM techniques to test all our products.

EFBE, TESTING CENTER IN GERMANY

After EN testing at Cycling & Health Industry R&D Center (in Taiwan) we send our products for further inspections to EFBE in Germany, so that we can assure our high expectations and meet the international standard.

S/SAFE

23-01

Comes with one long bottle cage screw and two seatpost adapters.

MATERIAL: AL6061-T6

The easy-to-use S/SAFE pin secures your seatpost from stolen. Install the S/SAFE pin inside the seatpost. Then, screw tight the provided bottle cage screw. The long screw thus jams the passage of the S/SAFE pin, preventing the seatpost from pulled up.
